Abstract

The Study Planner System is a software solution designed to help students manage their study time effectively. Many students struggle with poor time management and unstructured study habits, which negatively affect their academic performance. This project addresses this issue by allowing users to add subjects with their difficulty level and remaining study days. Based on this data, the system calculates a priority score for each subject and generates a personalized study plan according to the user's available daily study hours. The system ensures fair and efficient time distribution, helping students focus on the most important subjects first. The project applies Object-Oriented Programming (OOP) concepts such as inheritance, encapsulation, and polymorphism. The expected outcome is a simple, practical, and user-friendly tool that improves study efficiency and organization.
